

PORTABLE FILE STORAGE CONTAINER

Abstract

A storage container has a base defining a bottom wall and a side wall extending upwardly from the bottom wall to define a storage receptacle. A first cover section is coupled to the base side wall and extends over a portion of the storage
5 receptacle. An exterior side of the first cover section defines a writing surface. A second cover section is pivotably coupled to the base side wall and movable between a closed position, in which the second cover section overlies a remaining portion of the storage receptacle, and an open position, in which the second cover section is
10 rotated away from the storage receptacle. The storage container may have an overall profile height that is sufficiently low to allow insertion of the storage container into a stowage space having a low profile height.
